

## Sustainable Development

Are you struggling to understand the principles and practice of sustainable development?

ULI's Sustainable Development Panels equip public agencies and developers to plan and implement policies and projects that achieve the triple bottom line of economic, social, and environmental sustainability. These panels integrate diverse sustainability issues: smart growth, transit-oriented development, green infrastructure, green building, alternative transportation, jobs-housing balance, housing equity, social capital, carbon emissions, and more. Panels provide objective, grounded advice that help communities and projects become more sustainable.

All ULI panel teams include professionals with diverse points of view—engineers, developers, planners, designers, investors, market analysts, and public officials—who work together to generate grounded, innovative solutions.

Sponsors for these panels include:

- Developers
- Design Firms
- Local Governments

Past panels on this topic include:

Tradition Master-Planned Community, Biloxi, Mississippi  
Spring Creek Ranch New Town, Blaine County, Idaho  
Springfield, Massachusetts

A ULI panel provided strategic advice to a developer for a socially, environmentally and economically sustainable community for workers and year-round residents of a growing gulf coast area.
